# Neural Networks

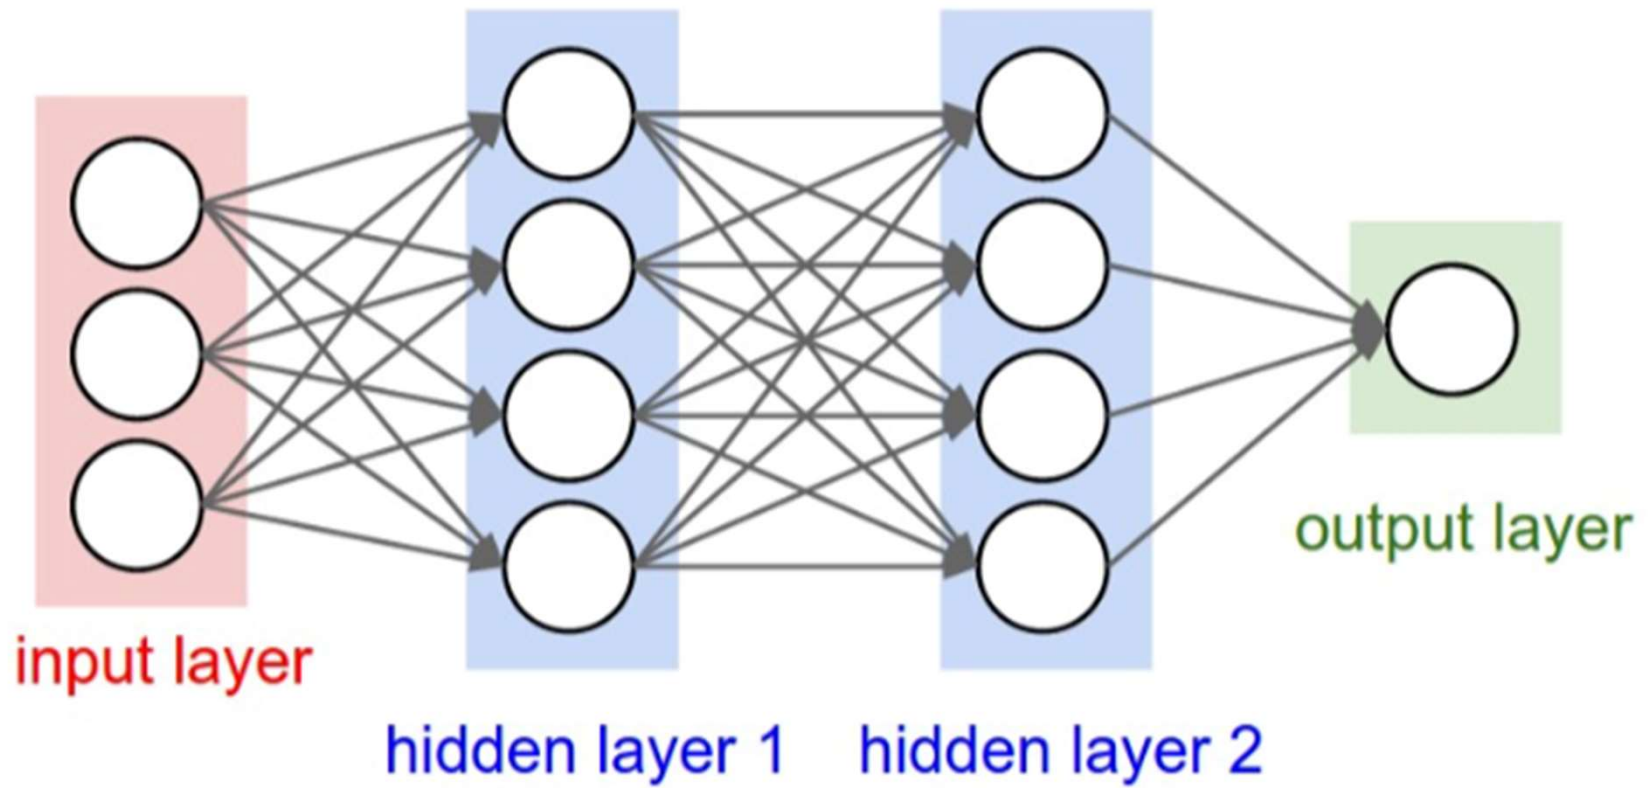

---

# Deep Learning

- A virtual neural network able to perform a single task as to extract patterns in images (medical or not)
- The potential goes from segmentation to extraction of complex radiomic features

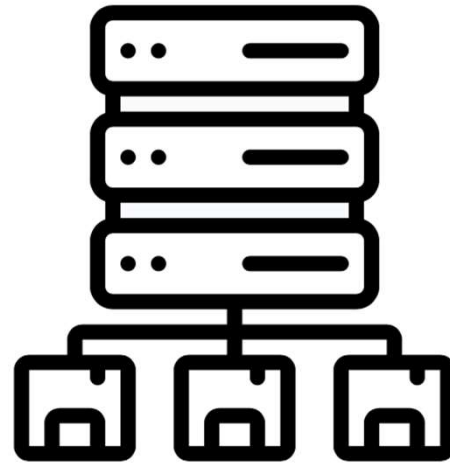

## Biological Neuron versus Artificial Neural Network

## 3 conditions to effectively train neural networks :

- Access to a large **Database** ; large enough to correctly train the network
  - Access to a **Correct labelling** in digital form
  - Access to **Computing power** to accelerate the process of training(GPUs)
- 
- After training, the network is usable to perform predictions on new data.

## Clinical Use

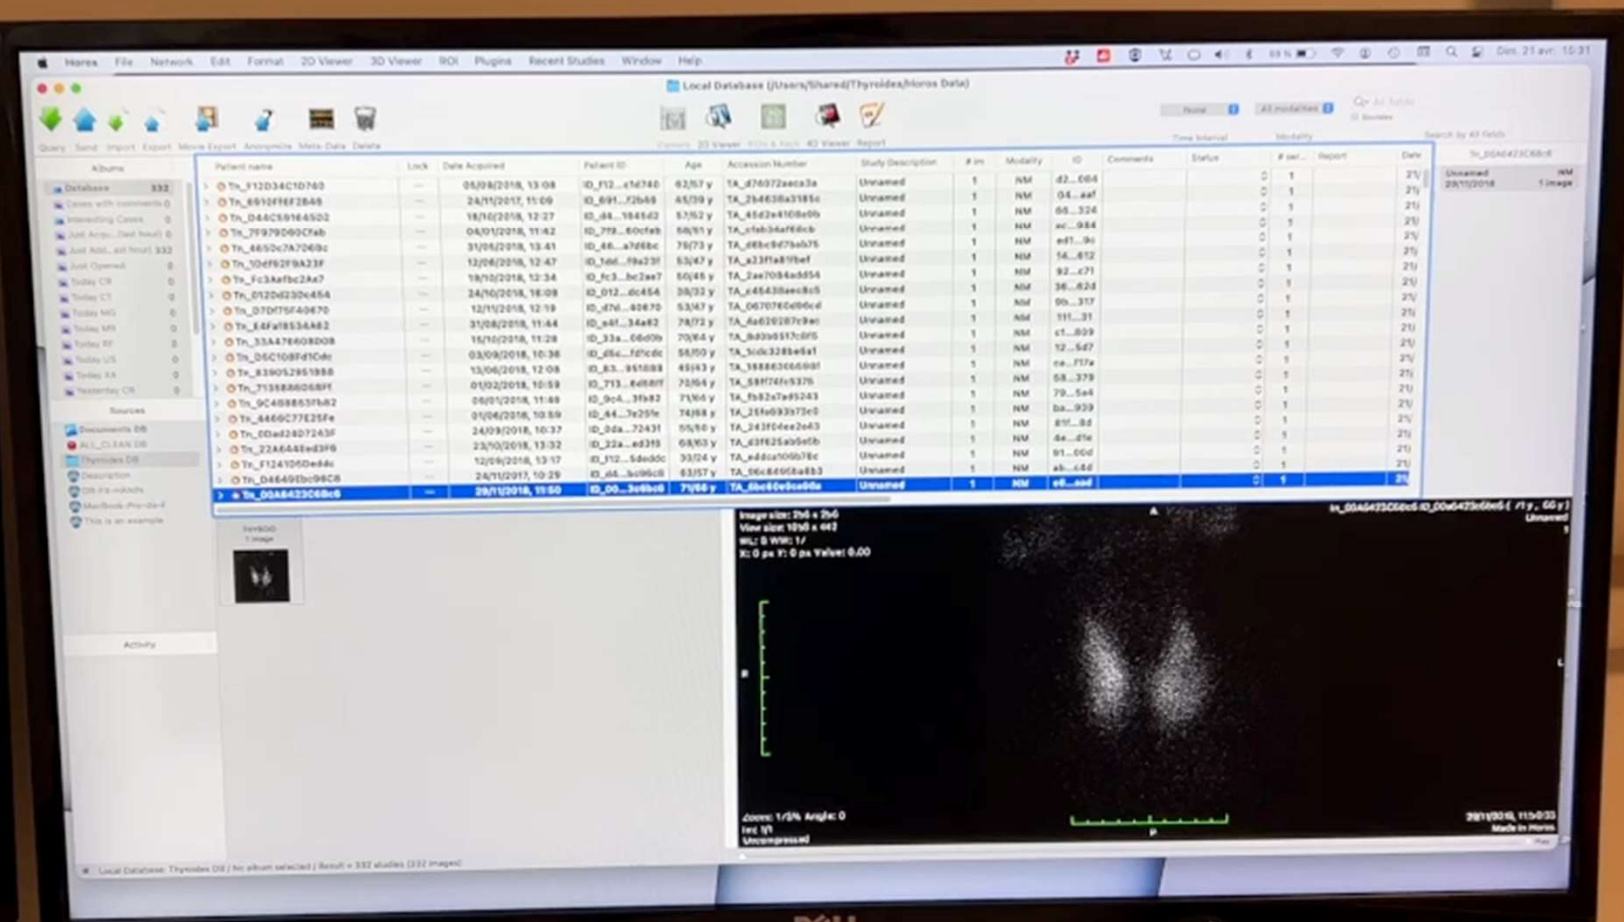

# 2 sides of development

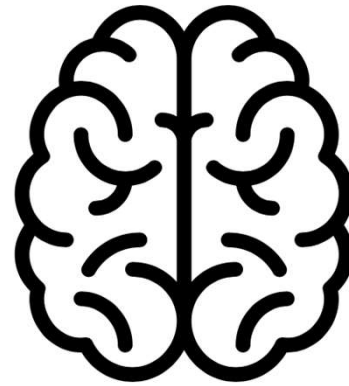

## AI pure deep Learning

- Collect and preparation of data (data mining)
- Compilation of network architecture
- Training(s) to obtain a valid network
- Verification of performance with validation and test data

## Solution for use Clinical daily

- Incorporation of networks, libraries, and rules of functioning in a dicom server
- Pure backend server - no GUI
- Can handle multiple data interpretation based on rules related to dicom header
- Upgrade or versionning invisible to end user

---

## Conclusions

---

# Conclusions - 1

This small project has no major clinical impact but reached mainly 2 objectives:

- Get hands in AI and finish an entire project from data mining, deep learning training, and clinical availability in a way to get ready for **larger projects**
- This project is a demonstration that deep learning can create added value to the interpretation of **Any** nuclear medicine image in a clinically acceptable time

# Conclusions

- We – as a scientific community – have all the data and skills to establish **LARGE** databases in nuclear medicine that will lead the way to an increased data extraction of image features.
- The understanding of underlying processes is necessary to maintain a critical interpretation of results
- Detection of cold nodules is **very sensitive** but not specific **BY DESIGN** – as an adjuvant to interpretation, **NOT a substitute**
